Maji Ndongo: Water Quality Dashboard and Impact Analysis

Children Vulnerability Index

The Children Vulnerability Index combines the number of children reached in each province with biological contamination levels to calculate a **Risk Score = Children × Contamination**. Higher scores indicate areas where the most children are exposed to the worst water quality.

Province	Children	Contamination	Risk Score	Priority
Hawassa	580	126	73,080	CRITICAL
Kilimani	640	98	62,720	HIGH
Sokoto	400	144	57,600	HIGH
Akatsi	820	44	36,080	MODERATE
Amanzi	340	88	29,920	LOW

Key Findings:

- **Hawassa** ranks #1 in vulnerability despite having fewer children than Akatsi — its high contamination (126) drives the risk score to 73,080.
- **Akatsi** serves the most children (820) but has the lowest contamination (44), making it a model for effective water management.
- **Sokoto** has the highest contamination (144) but fewer children, placing it 3rd — however, the per-child exposure risk remains the highest.
